Operations management by william j. stevenson 13th edition solutions

Operations management by william j. stevenson 13th edition solutions

Clear and concise. Comprehensive breadth with less depth of operations management topics. Includes applications and mini cases. Written for a 300-level survey course combining OM and Supply Chain. Clear and concise, with moderately comprehensive topic coverage, including some global cases. Suitable for a 300-level traditional- or case-based survey course Less breadth, but more comprehensive depth of OM topics and more emphasis on process and application. breadth and more depth of OM and supply chain topics with a sustainability chapter. Written for the 300-level undergrad survey course Each chapter is structured around a company example. Suitable for a 400-level or graduate/MBA introductory OM course and applications based McGraw Hill Connect® for Introductory Operations Management provides the most comprehensive solution to the market. Each asset in Connect is designed to address pressing course is designed, we have a solution that's got you covered. Learn more about Connect SmartBook - The first and only adaptive reading and study experience designed to change the way students read and master key course concepts. As a student engages with SmartBook, the program creates a personalized learning path by highlighting the most impactful concepts the student needs to learn at that moment in time and delivering targeted probing questions. This rich, dynamic delivery helps students learn the material, retain more knowledge, and get better grades. OM Video Series - These on-location videos highlight real companies and their actual manufacturing processes, bringing key operations management topics to life. These videos are mapped to topics and chapters and are available within the Connect resources. Concept Overview Videos - These assignable videos with additional reinforcement on core topics in the chapters. Created by instructors, these personal videos will bring online courses to life and help supplement any face-to-face class. The videos are followed by auto-graded concept-check questions that are organized by chapter within Connect. Guided Examples provide narrated and animated, step-by-step walkthroughs of versions of assigned problems. This allows students to identify, review, or reinforce the concepts and activities covered in class. Guided Examples provide immediate feedback and focus on the areas where students need the most guidance. Static & Algorithmic Problems Each chapter includes a set of problems from the text to assign for homework. A combination of conceptual and step-by-step questions help students reinforce and apply their learning. Simulations - Practice Operations is a simulated game where students play the owner of a clothing manufacturing and distribution company. They must make strategic decisions and operate their growing virtual business at a profit. Students bid for contracts, source raw materials like cotton and denim, buy and set up machines to cut, sew, and produce different kinds of apparel, and deliver finished goods to their customers. Students learn and practice each of these skills while working their way up to managing the entire operation. Available currently as a salable widget in Connect. Operations Textbooks | Business & Economics T cookies, tracking statistics, etc. Read more 1 CHAPTER 13 INVENTORY MANAGEMENT Solutions 1. a. Given: Determine an A-B-C classification for the following items: Item Unit Cost Annual Volume (00) 1 \$ \$ \$ \$ \$ 60 85 Step 1: Determine the Annual Dollar Value (Unit Cost * Annual Volume) for each item and the sum of the individual Annual Annual Volume (00) 1 \$ \$ \$ \$ Dollar Values. Item Unit Cost Annual Dollar Values. Determine the A, B, and C items. Then, and C items in descending order based on Annual Dollar Values. Determine the A, B, and C items. Then, determine the percentage of items and the percentage of Annual Dollar Value for each category (round to two decimals). Item Annual Dollar Value 6 \$5,100 A 1 2, % [(1/6)*100] 33.33% 41.91% [(\$5,100/\$12,170)*100] 40.26% 2 2,400 B [(2/6)*100] [(\$4,900/\$12,170)*100] C 50.00% [(3/6)*100] 17.83% [(\$2,170/\$12,170)*100] 12, % % b. Given: D = 4,500, S = \$36, and H = \$10. Find the EOQ (round to an integer value): Q 2DS H 2(4,500) units c. Given: D = 18,000/year, S = \$100, H = \$40 per unit per year, p = 120 units per day, and u = 90 units/day. Find the economic production quantity (EPQ) (round to an integer value): ()() 13-2 Copyright 2015 McGraw-Hill All rights reserved. Step 1: Determine current total cost for Q = 800 (the manager orders once per month). ()()() Step 2: Determine EOQ, total cost for EOQ, and annual savings from using the EOQ. 2DS 2(9,600)28 Q H crates ()()()() Savings per year from using EOQ = \$1,736 \$1, = \$ Copyright 2015 McGraw-Hill All rights reserved. No reproduction or distribution without the prior written consent of McGraw-Hill 11 7. Given: Demand is projected to be 600 units for the first half of the year and 900 units for the second half. The monthly holding cost is \$2 per unit, and it costs an estimated \$55 to process an order. a. Assuming that monthly demand will be level during each six-month period, determine an order size that will minimize the sum of ordering and carrying costs for each six-month period: D = monthly demand = 900 / 6 = 150 & H = \$2.00 per unit per month. 2dS 2(100)55 Q H units Second six-month period: D = monthly demand = 900 / 6 = 150 & H = \$2.00 per unit per month. 2dS 2(150)55 Q H units b. We can use the EOQ only if demand is level (stable). c. If the vendor is willing to offer a discount of \$10 per order for ordering in multiples of 50 units (e.g., 50, 100, 150), would you advise the manager to take advantage of the offer in either six-month period? If so, what order size would you recommend? First six-month consent of McGraw-Hill 12 Monthly TC (Q = 150): ()()() () Conclusion: Yes, the manager should take advantage of the offer and order Q = 50 units during this six-month period. Second six-month period: d = monthly demand = 900 / 6 = 150, H = \$2.00 per unit per month, S = \$55, & EOQ = 91. Monthly TC (Q = 91): ()()()() () () With discount of the offer and order Q = 50 units during this six-month period. written consent of McGraw-Hill 13 8. Given: d = 27,000 jars per month H = \$0.18 per jar per month S = \$60 Company operates 20 days a month Current Q = 4,000 Note: Round the EOQ to an integer value, but round any other values to a maximum of two decimals. a. What penalty is the company incurring by its present order size? Step 1: Determine reserved. No reproduction or distribution without the prior written consent of McGraw-Hill 14 b. The manager would prefer ordering 10 times each month (every other day) but would have to justify any change in order size. One possibility is to simplify order processing to reduce the ordering cost. What ordering cost would enable the manager to justify ordering every other day? Using the current Q = 4,000, total monthly cost = \$765. If the manager orders 10 times per month, Q = 27,000 / 10 = 2,700. Set TC (Q = 2,700) = \$765 and solve for S: ()()()() S = \$522 / 10 S = \$52.20 (round to two decimals). This is the order cost that would enable the manager to justify ordering every other day Copyright 2015 McGraw-Hill All rights reserved. No reproduction or distribution without the prior written consent of McGraw-Hill 15 9. Given: p = 5,000 hotdogs/day u = 250 hotdogs/day Factory operates 300 days per year D = 250 * 300 = 75,000 hotdogs per year S = \$66 H = \$0.45 per hotdog per year Note: Round Q p to an integer value, but round any other values to a maximum of two decimals. a. Find the optimal run size: Q p 2DS H p p u 2(75,000) ,000 5, , ,812 hotdogs b. Number of runs per year c. Days to produce the optimal run quantity: Q p / p = 4,812 / 5,000 = 0.96 days Copyright 2015 McGraw-Hill All rights reserved. No reproduction or distribution without the prior written consent of McGraw-Hill 16 10. Given: A chemical firm produces 100-pound bags. Demand for the product = 20 tons per day. The capacity = 50 tons per day. The capacity = 50 tons per day. The firm operates 200 days a year. Note: 1 ton = 2,000 pounds. p = 50 tons per day * 2,000 pounds per ton = 100,000 pounds per day = 100,000 pounds per day = 100,000 pounds per day = 20 tons per day = 20 tons per day = 20 tons per day = 40,000 pounds per day = 40,000 pounds per day = 40,000 pounds per day = 400 bags per day = 40,000 pounds per day = consent of McGraw-Hill 17 11. Given: Assembly takes place 5 days a week, 50 weeks a year. It will take a full day to get the machine ready for a product. S = \$300 H = \$10.00 p = 200/day u = 80/day D = 20,000 (250 days * 80/day) Note: Round Q p to an integer value, but round any other values to a maximum of two decimals. a. Optimal run quantity to minimize total annual costs: Q p 2DS H p p u 2(20,000) , ,414 units b. Days to produce the optimal run quantity: Q p p 1, days c. Average amount of inventory: () () units units d. The manager would like to run another job between runs of the component for the new product and needs a minimum of 10 days per cycle (including setup) for the other job: How much time is available to run the other job must be finished during the pure consumption time is when inventory of the component for the new product. The end of the pure consumption time is available to run the other job must be finished during the pure consumption time is available to run the other job must be finished during the pure consumption time is available to run the other job must be finished during the pure consumption time is available to run the other job must be finished during the pure consumption time is available to run the other job must be finished during the pure consumption time is available to run the other job must be finished during the pure consumption time is available to run the other job must be finished during the pure consumption time is available to run the other job must be finished during the pure consumption time is available to run the other job must be finished during the pure consumption time is available to run the other job must be finished during the pure consumption time is available to run the other job must be finished during the pure consumption time is available to run the other job must be finished during the pure consumption time is available to run the other job must be finished during the pure consumption time is available to run the other job must be finished during the pure consumption time is available to run the other job must be finished during the pure consumption time is available to run the other job must be finished during the pure consumption time is available to run the other job must be finished during the pure consumption time is available to run the other job must be finished during the pure consumption time is available to run the other job must be finished during the pure consumption time is available to run the other job must be finished during the pure consumption time is available to run the other job must be finished during the pure consumption time is available to run the other job mu pure consumption time, we will run out of inventory of the component for the new product. This is the time between starting production runs of the component for the new product. Plugging in values and solving for Pure Consumption Time: Conclusion: There will not be enough time to run the other job because the other job requires 10 days, which is.39 days () days too many Copyright 2015 McGraw-Hill All rights reserved. No reproduction or distribution without the prior written consent of McGraw-Hill 18 e. Three options that the manager could consider that will allow this other job to be performed: 1) Try to shorten the setup time of the component for the new product. 2) Increase the run quantity of the component for the new product to allow a longer time between runs, i.e., run the component for the new product and the increase in total annual cost from this new Q: We know the following: The Pure Consumption Time for the new product and the increase in total annual cost from this new Q: We know the following: The Pure Consumption Time for the new product and the increase in total annual cost from this new Q: We know the following: The Pure Consumption Time for the new product and the increase in total annual cost from this new Q: We know the following: The Pure Consumption Time for the new product and the increase in total annual cost from this new Q: We know the following: The Pure Consumption Time for the new product and the increase in total annual cost from this new Q: We know the following: The Pure Consumption Time for the new product and the increase in total annual cost from this new Q: We know the following: The Pure Consumption Time for the new product and the increase in total annual cost from this new Q: We know the following: The Pure Consumption Time for the new product and the increase in total annual cost from this new Q: We know the following: The Pure Consumption Time for the new product and the increase in total annual cost from the new product and the increase in total annual cost from the new product and the increase in total annual cost for the new product and the increase in total annual cost from the new product and the increase in total annual cost from the new product and the increase in total annual cost for the new product and the increase in total annual cost from the new product and the increase in total annual cost from t the component for the new product must equal 10 days to allow the other job to be run. p = 200/day, u = 80/day, and Pure Consumption Time = 10 days. Plugging in values and solving for Q p : [] Using the least common denominator: () The additional units per run = 1,467 1,414 = 53 units per run Copyright 2015 McGraw-Hill All rights reserved. No of the heating unit = 0 units Total inventory after the first 2 days of production = 0 + 1,000 = 1,000 units. c. Average Inventory: I max Q 2,000 (p u) () 1,250 units p Copyright 2015 McGraw-Hill All rights reserved. No reproduction or distribution without the prior written consent of McGraw-Hill 20 d. The other component requires 4 days (including setup). Setup time for the heating element = 0.5 days. Is there enough time to run the other component must be finished during the pure consumption time for the heating element. The end of the pure consumption time is when inventory of the heating element falls to 0 units. If the other component takes longer than the pure consumption time, we will run out of inventory of the heating element. This is the time between starting production runs of the heating element. Plugging in values and solving for Pure Consumption Time: Conclusion: There will not be enough time to run the other component because the other component requires 4 days, which is.33 (4 3.67) days too many Copyright 2015 McGraw-Hill All rights reserved. No reproduction or distribution without the prior written consent of McGraw-Hill 21 13. Given: D = 18,000 boxes/year S = \$96 H = \$.60/box/year Price Schedule: Number of Boxes Price per Box (P) 1,000-1,999 \$1.25 2,000-4,999 \$1.20 5,000-9,999 \$.000+ \$1.10 a. Determine the optimal order quantity (round to an integer value): Step 1: Compute the common minimum point. Q 2DS H 2(18,000) ,400 boxes This quantity is feasible in the range ,999. Step 2: Determine total cost for the common minimum point and for the price breaks of all lower unit costs. This number of cakes will maximize the expected payoff Copyright 2015 McGraw-Hill 51 43. Given: On average, 18 ticket holders cancel their reservations, so the company intentionally overbooks. the flight. Cancellations can be described by a normal distribution with a mean equal to 18 and a standard deviation of Profit per passenger = \$99. If a passenger = \$99. C e = \$200 Cs SL C C s e Using Appendix B, Table B, we find that 3311 falls closest to.3300: z = ()() tickets to overbook Copyright 2015 McGraw-Hill All rights reserved. No reproduction or distribution without the prior written consent of McGraw-Hill S2 Case: UPD Manufacturing Given: OI = 6 weeks S = \$32 H = \$.08/unit/week d = 89 units/week LT = 5 working days = 1 week 1. Students must recognize that without demand variability, the fixed order interval order quantity equation reduces to: () UPD places an order every 6 weeks and the lead-time is 1 week * 89 units/week). Because A = 89 = d x LT, the fixed order interval order quantity equation further reduces to the following: () () () () units Therefore, ordering at six-week intervals requires an order quantity of 534 units. Optimal order quantity as determined by using the basic EOQ equation: Q 2dS h 2(89)(32) (round to an integer value) The weekly total cost based on six-week fixed order interval (FOI) order quantity is given below: d Q TCFOI S H Q TC \$26.69/ week FOI to EOQ are relatively small and switching to the optimal order quantity may not be warranted. However, if the FOI approach is used with other parts or components as well, the total potential loss may be significant Copyright 2015 McGraw-Hill All rights reserved.
